ESD 300 kV Generator

The system is designed to perform electrostatic tests up to 300 kV according to NATO AECTP 250 (helicopter test), AECTP 500, MIL-STD 331C, etc. It consists of a high voltage DC power supply, a special capacitor, a control unit driven by a PC-based software and an orientable moving electrode which is actuated pneumatically by the control unit. The electrode can be placed toward the tested aircraft in many orientations in order to reach the spot to stress. The system can be used to perform following tests:

a. Discharge between a charged electrode and a grounded EUT  
b. Discharge between a charged EUT and a grounded electrode  
c. Charged EUT for precipitation static (P-static) test

Example of test setup
Charged electrode and grounded EUT

The ESD is generated by charging up an electrode to the specification voltage, and then discharging the electrode to grounded EUT.

The discharge current pulse is monitored by an embedded oscilloscope. A computer running Montena Pulse Control software controls the HV generator through a fibre optic transmission, that allows to electrically isolate the operator from the test setup.
